DETAILED ACTION

Claim Objections

1. Claim 26 is objected to because of the following informalities: In line 13, the word "he" should be changed to "the". Appropriate correction is required.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 18-23 and 26-29 are rejected under 35 U.S.C. 103(a) as being unpatentable over Goddard ('209) in view of Manuli ('897).

Goddard discloses in a corrugated pipe comprising two sections joined by telescopically mating a male end of one section with a female end of the other section, the improvement comprising an annular sealing element (60) fixed to the exterior surface of the male end and disposed to sealingly engage the interior surface of the female end; Goddard does not disclose an annular band of reinforcing material disposed around the exterior surface that is in general alignment with the sealing element. Manuli teaches (see Fig. 4) placing an annular band (25) of reinforcing material around an exterior surface that is in general alignment with a sealing element (17). Manuli teaches the annular band helps the sealing element maintain sealing engagement with two surfaces (see col. 5, lines 1-20). As it would be advantageous to maintain sealing engagement between the two pipe sections it would be obvious to one of ordinary skill in

the art to modify the pipe disclosed by Goddard to have the annular reinforcing band as taught by Manuli.

Referring to claim 19, Goddard discloses wherein the annular sealing element (60) is disposed in an annular channel in the outer surface of the male end.

Referring to claim 20, Goddard discloses wherein each section includes opposed male and female ends (18,20) and the outside pipe diameter of each section between its respective male and female ends is substantially the same.

Referring to claim 21, Goddard discloses wherein the outside diameter of the female end (20) of each section is substantially the same as the outside pipe diameter.

Referring to claim 22, Goddard discloses wherein the male end includes at least two corrugations (32,42) comprising at least two axially spaced, annular crests and an annular valley therebetween, the two crests defining the outside diameter of the male end, and wherein the annular channel (55) is formed in one of the crests.

Referring to claim 23, Goddard discloses wherein the outside diameter of the male end (18) is selected to permit mating and sealing engagement with the female end (20).

Referring to claim 26, Goddard discloses a corrugated pipe comprising two sections joined by telescopically mating a male end of one section with a female end of the other section, wherein the diameter of the female end (20) is substantially the same as the diameter of the corrugated pipe; and the male end (18) includes a corrugation having a recessed area (55) for accommodating an annular sealing element (60) for sealingly engaging an interior surface of the female end; and the corrugation height is such that the corrugation and the annular sealing element can be accommodated in the female end; the corrugated pipe section further comprising

Art Unit: 3672

Goddard does not disclose an annular band of reinforcing material disposed around the exterior surface of the female end. Manuli teaches (see Fig. 4) placing an annular band (25) of reinforcing material around an exterior surface that is at a position that allows the reinforcing material to retain sealing engagement between a female end and an annular sealing element (17) on a pipe end (17). As it would be advantageous to maintain sealing engagement between the two pipe sections it would be obvious to one of ordinary skill in the art to modify the pipe disclosed by Goddard to have the annular reinforcing band as taught by Manuli.

Referring to claim 27, Goddard discloses wherein the male end also includes a second corrugation (32) that can be accommodated in the female end.

Referring to claim 28, Goddard discloses wherein the female end (20) includes a distal end into which the male end is inserted, and a third corrugation (42) with a crest that extends radially outwardly at least as far as the distal end of the female end.

Referring to claim 29, Goddard discloses a corrugated pipe for accommodating fluid flow, the pipe consisting of a material that deforms in response to internal water pressure and including two sections joined by telescopically mating a male end of one section with a female end of the other section, the improvement comprising an annular sealing element (60) fixed to the exterior surface of the male end and disposed to sealingly engage the interior surface of the female end. Goddard does not disclose an annular reinforcement disposed around the exterior surface of the female end, the annular reinforcement having a width that is greater than the width of the sealing element and is disposed substantially upstream from the sealing element to resist loss of sealing engagement between the female end and the sealing element during use of the pipe. Manuli teaches (see Fig. 4) placing an annular reinforcing material (25) have a width

Art Unit: 3672

greater than the width of a sealing element (17) and is disposed substantially upstream for the sealing element. Manuli teaches the annular band helps the sealing element maintain sealing engagement with two surfaces (see col. 5, lines 1-20). As it would be advantageous to maintain sealing engagement between the two pipe sections it would be obvious to one of ordinary skill in the art to modify the pipe disclosed by Goddard to have the annular reinforcing band as taught by Manuli.

3. Claims 24 rejected under 35 U.S.C. 103(a) as being unpatentable over Goddard ('209) in view of Manuli ('897) as applied to claim 22 above, and further in view of European Patent EP595742 to Courant.

Goddard, as modified, does not disclose an intermediate corrugation that has an outside diameter greater than the outside diameter of the male end. Courant teaches (see Fig. 10) a pipe having an intermediate corrugation (23a) that has an outside diameter greater than the outside diameter of a male end. Courant teaches the larger diameter of the intermediate corrugation allows the intermediate to have better engagement with the female end of a second pipe (see Fig. 11). As it would be advantageous for the two pipes being connected to have a good engagement with each other, it would be obvious to one of ordinary skill in the art to further modify the pipe disclosed by Goddard to have an intermediate corrugation that has an outside diameter greater than the outside diameter of the male end as taught by Courant.

Application/Control Number: 10/037,219 Page 6

Art Unit: 3672

Allowable Subject Matter

4. Claim 25 objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Response to Arguments

5. Applicant's arguments with respect to claims 1-24 and 26-29 have been considered but are most in view of the new ground(s) of rejection.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Giovanna M. Collins whose telephone number is 703-306-5707. The examiner can normally be reached on 6:30-3 M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, David J. Bagnell can be reached on 703-308-2151. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-308-1113.
